AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the

application.

1. (Currently amended) A seal configuration, comprising:

a body that contains internal pressure, the body having an opening with inwardly

tapered peripheral sidewalls;

a closure that closes the opening, the closure having an attachment portion larger

than the opening and an axially projecting stopper portion that fits closely within the opening, the

stopper portion having an endless peripheral seal groove extending in spaced relation around the

axis in which is positioned a peripheral seal that sealingly engages the tapered peripheral

sidewalls of the body in interference fit relation, thereby conforming to the tapered peripheral

sidewalls; and

a backing ring of pliable memory retaining material sheltered from internal

pressure within the body by the peripheral seal and positioned between the peripheral seal groove

and the attachment portion of the closure, the backing ring engaging the tapered peripheral

sidewall of the body in interference fit relation and conforming to the tapered peripheral sidewall

while being sufficiently stiff as to resist extrusion flow under pressure, such that when the

peripheral seal deforms in response to an increase in internal pressure within the body and

extrusion gaps begin to form between the attachment portion of the closure and the body, the

peripheral seal is extruded applying a force solely in an axial direction against the backing ring,

that portion of the backing ring engaging the tapered peripheral sidewall of the body plastically

deforming by changing shape and applying sealing pressure at the extrusion gaps to prevent the

peripheral seal from entering the extrusion gaps.
